

## Fine Tuning of the Training Data:

### 1. Created an Additional File for Create Leads with mandatory fields:

```
===HTML===
<input type="text" class="inputBox" name="companyName" size="30" maxlength="100" id="createLeadForm_companyName">
<input type="text" class="inputBox" name="firstName" size="30" maxlength="100" id="createLeadForm_firstName">
<input type="text" class="inputBox" name="lastName" size="30" maxlength="100" id="createLeadForm_lastName">
<input type="submit" class="smallSubmit" name="submitButton" value="Create Lead" id="ext-gen519">

===JAVA===

package com.leaftaps.pages;

import com.framework.selenium.api.design.Locators;
import com.framework.testng.api.base.ProjectSpecificMethods;

/**
 * Page object representing the Create Lead page.
 * Provides methods to create leads and submit changes.
 * @author Auto-generated
 */
public class CreateLeadPage extends ProjectSpecificMethods {

    public CreateLeadPage companyName(String companyName) {
        clearAndType(locateElement(Locators.ID,"createLeadForm_companyName"), companyName);
        reportStep(companyName +" Company name is entered successfully", "pass");
        return this;
    }

    public CreateLeadPage firstName(String firstName) {
        clearAndType(locateElement(Locators.ID,"createLeadForm_firstName"), firstName);
        reportStep(firstName +" first name is entered successfully", "pass");
        return this;
    }

    public CreateLeadPage lastName(String lastName) {
        clearAndType(locateElement(Locators.ID,"createLeadForm_lastName"), lastName);
        reportStep(lastName +" Last name is entered successfully", "pass");
        return this;
    }

}
```

### 2. Converting the Training data to jsonl files: Total 11 Files (Including Create Leads File):

## Week 4 Day1 Assignment for Fine Tuning & AI Extension Integration

### 3. Beautified Sample Training data:

Here's a cleaner and more readable version of your payload with proper formatting and indentation:

```
<> JSON 
```

```
{
  "messages": [
    {
      "role": "system",
      "content": "You are an expert in generating Selenium Java page object classes using provided DOM"
    },
    {
      "role": "user",
      "content": "Given the following DOM structure:\n```html\n<input type=\"text\" size=\"20\" autoc"
    },
    {
      "role": "assistant",
      "content": "package com.leafyaps.pages;\n\nimport com.framework.selenium.api.design.Locators;\n"
    }
  ]
}
```

4. Fine Tuned the Training data using TestLeaf Models:

## 5. AI Extension Integration of the TestLeaf Models:

## 6. Feature File and Page Class Generation using TestLeaf Fine Tuned Model:

### Generated Data:

#### Feature: Login to OpenTaps

#### Scenario Outline: Successful login with valid credentials

Given I open the login page

When I type "<username>" into the Username field

And I type "<password>" into the Password field

And I click the Login button

Then I should be logged in successfully

**Examples:**

|          |            |
|----------|------------|
| username | password   |
| "admin"  | "admin123" |
| "user1"  | "user123"  |
| "user2"  | "user456"  |

```
package com.leaftaps.stepdefs;
```

```
import io.cucumber.java.en.*;
